DOI:10.37648/ijtbm.v16i01.012

[1]*Received: 19 January 2026; Accepted: 08 February 2026; Published: 09 March 2026*

Abstract

Waste management policy is important for the promotion of the circular economy because it promotes the efficient use of resources, reduces the amount of waste generated, enhances recycling practices and minimizes the degradation of the environment. The traditional linear economic model based on principles of produce, consume and throw has created serious environmental and economic challenges such as the depletion of resources, pollution, greenhouse gas emissions and increasing pressure on landfills. Conversely, circular economy seeks to minimize, reuse, recycle, recover and regenerate resources for sustainable economic growth. Rapid urbanization, industrialization, population growth and changing consumption patterns are responsible for the increasing generation of municipal solid waste, plastic waste, electronic waste and industrial waste in India. Government efforts such as Solid Waste Management Rules, 2016, Plastic Waste Management Rules, 2016, Extended Producer Responsibility (EPR), Swachh Bharat Mission and various recycling initiatives have set an institutional framework for transitioning toward a circular economy. The paper deals with the question of impact of waste management policies on circular economic development in India with special reference to resource efficiency, recycling industries, employment generation, environmental protection and sustainable production. It explores secondary data available from government policies and institutional reports to understand the relation between waste management practices and circular economy activities. The study emphasizes the importance of successful policy implementation, technological innovation, public participation, private sector investment and institutional coordination to achieve a sustainable circular economy.

Keywords: *Waste Management Policy; Circular Economy; Recycling; Resource Efficiency; Extended Producer Responsibility; Sustainable Development; Environmental Economics.*

Introduction

Waste management has become one of the most important challenges for modern economies. The continuous increase in waste production throughout the world is the result of population growth, urbanization, industrial development and changing consumption patterns. Improper disposal of solid waste, plastic materials, electronic products and industrial residues leads to environmental pollution, public health hazards and economic losses. The traditional economic system is based on a linear production model, where natural resources are taken, turned into products, used and then thrown away as waste. This model places an enormous burden on natural resources and ecosystems. The growing scarcity of raw materials, the increasing costs of waste disposal and environmental damage have led governments and industries to seek alternative economic strategies. The circular economy is an important alternative to the traditional linear economy. It encourages the continued use of materials through reduction, reuse, repair, refurbishment, recycling and recovery. The circular economy is not a disposal of waste as a by-product but a potential source of economic resource. The institutional and regulatory basis for this transition is provided by policies on waste management. These policies set standards for the collection, segregation, transportation, processing, recycling and environmentally safe disposal of waste. They also promote producers taking responsibility for products after their useful life.

Waste Management and Economic Development

Waste management is not merely an environmental activity; it also has significant economic implications. Efficient waste management can:

1. Reduce the consumption of virgin natural resources.
2. Promote recycling and secondary raw material industries.
3. Generate employment opportunities in waste collection and processing.
4. Reduce the cost of environmental pollution.
5. Encourage sustainable industrial production.
6. Promote technological innovation and green entrepreneurship.
7. Improve urban environmental quality and public health.

Circular Economy in the Indian Context

India is experiencing rapid economic transformation accompanied by increasing consumption and waste generation. The expansion of manufacturing, construction, information technology, packaging, retail trade and urban services has increased the demand for effective waste management systems. The Government of India has introduced several policy initiatives to strengthen waste management and resource recovery. These include the Solid Waste Management Rules, 2016, Plastic Waste Management Rules, 2016, E-Waste Management Rules, 2022, Battery Waste Management Rules, 2022, and Extended Producer Responsibility frameworks. These initiatives seek to integrate environmental sustainability with economic growth by encouraging recycling, resource recovery and responsible production.

The present study analyses how waste management policies influence the development of the circular economy in India and identifies the major challenges and opportunities associated with their implementation.

Review of Literature

The concept of the circular economy has attracted considerable attention among economists, environmental researchers and policymakers. Several studies have examined the relationship between resource efficiency, environmental regulation, recycling and sustainable economic development.

Pearce and Turner (1990): Pearce and Turner introduced the concept of the circular economy through their work on the economics of natural resources and the environment. They explained the importance of integrating economic activities with environmental systems and highlighted the limitations of the traditional linear economic model.

Stahel (2016): Stahel emphasised the importance of extending product life cycles through reuse, repair, refurbishment and recycling. He argued that circular economic activities can reduce resource consumption and generate economic opportunities through new business models.

Geissdoerfer et al. (2017): Geissdoerfer and colleagues examined the relationship between the circular economy and sustainability. Their research highlighted the potential of circular production and consumption systems to contribute to environmental protection and sustainable development.

Kirchherr, Reike and Hekkert (2017): Their research analysed different definitions of the circular economy and identified the importance of reducing, reusing and recycling materials. The study demonstrated that circular economic practices require changes in production, consumption and waste management systems.

Ghisellini, Cialani and Ulgiati (2016): The authors reviewed the development of circular economy concepts and highlighted the role of government policies, technological development and stakeholder participation in promoting sustainable resource management.

Ellen MacArthur Foundation (2019): The Foundation highlighted the economic and environmental opportunities associated with circular economic models. It emphasised the importance of designing out waste, maintaining products and materials in use and regenerating natural systems.

Indian Policy and Institutional Perspective: Indian government initiatives have increasingly focused on waste segregation, recycling, scientific waste processing and producer responsibility. The Ministry of Environment, Forest and Climate Change, Central Pollution Control Board and Ministry of Housing and Urban Affairs have developed regulatory and institutional mechanisms to strengthen waste management.

Research Gap

Although existing studies have examined waste management and circular economy principles, further investigation is necessary to understand how specific waste management policies influence economic activities, recycling industries, employment generation and resource efficiency in India.

The present study attempts to address this gap by examining policy frameworks, available statistical evidence, implementation challenges and the economic implications of circular waste management.

Objectives of the Study

The major objectives of the study are:

1. To examine the relationship between waste management policies and the development of the circular economy.
2. To analyse the major waste management policies and regulatory frameworks in India.
3. To study the contribution of recycling and resource recovery to sustainable economic development.
4. To evaluate the role of Extended Producer Responsibility in promoting circular economic activities.
5. To identify the economic and environmental benefits of effective waste management.
6. To examine the challenges associated with the implementation of waste management policies.
7. To suggest suitable policy measures for strengthening India's circular economy.

Research Methodology: The study is descriptive and analytical in nature. The research is based on secondary data collected from government reports, policy documents, research publications, international organisations and institutional databases. Percentage analysis, comparative analysis, trend interpretation and policy analysis are used to examine the influence of waste management policies on circular economic development. Study area: India, with reference to national waste management policies and their economic and environmental implications.

Analysis of Data and Discussion

This section examines the available statistical evidence relating to waste generation, recycling, processing and resource recovery in India. The analysis focuses on municipal solid waste, plastic waste and electronic waste.

Municipal Solid Waste Generation and Processing in India

Municipal solid waste is one of the major waste categories generated by urban and rural settlements. Its management is essential for maintaining environmental quality and promoting resource recovery. According to information submitted by 36 States and Union Territories for 2021–22 under the Solid Waste Management Rules, 2016, India generated approximately 170,339 tonnes of municipal solid waste per day.

Municipal Solid Waste Management in India, 2021–22

Particulars	Quantity (tonnes/day)	Percentage
Waste collected	156,449	91.84%
Waste processed/treated	91,511	53.72
Waste landfilled	41,455	24.34%
Total waste generated	170,339	

Source: Ministry of Environment, Forest and Climate Change, Government of India, 2024.

(IJTBM) 2026, Vol. No. 16, Issue No. I, Jan-Mar e-ISSN: 2231-6868 p-ISSN: 2454-468X

Statistical interpretation:

- Approximately 91.84% of the generated waste was collected.
- Around 53.72% was processed or treated.
- Approximately 24.34% was reported as landfilled.
- The remaining quantity was not accounted for in these three reported categories.

The data indicate that although a substantial proportion of municipal waste was collected, the proportion processed remained comparatively low. This suggests the need for stronger segregation, recycling infrastructure, composting facilities and scientific waste treatment. The gap between collection and processing also demonstrates the importance of improving the operational capacity of urban local bodies.

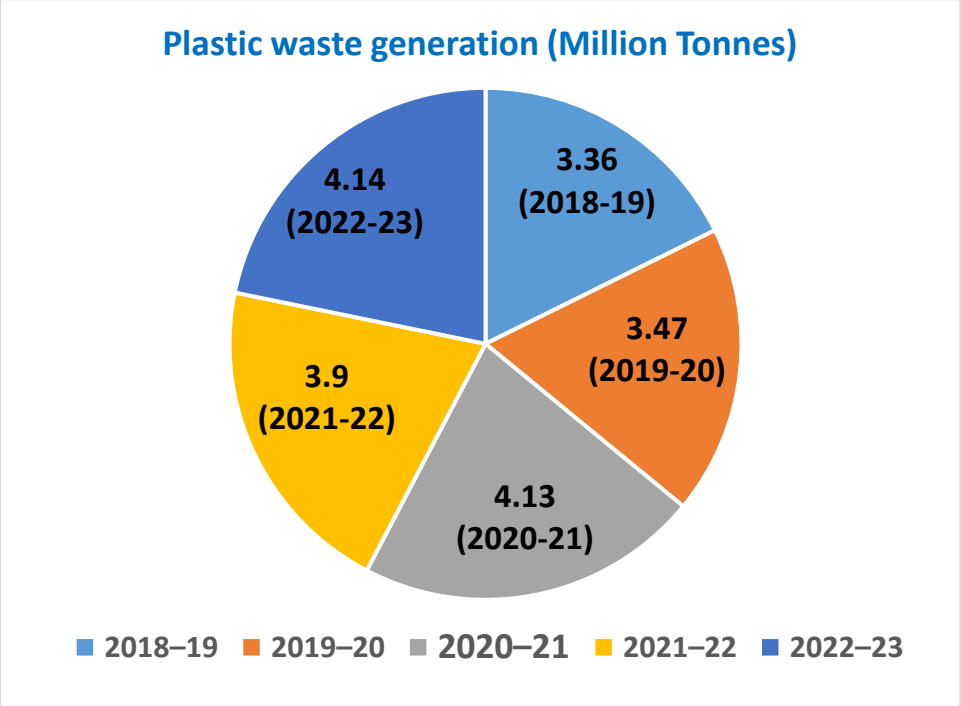
Plastic Waste Generation and Circular Economy

Plastic waste represents a significant environmental challenge because of its durability, widespread use in packaging and limited natural degradation. The Plastic Waste Management Rules, 2016, established an important regulatory framework for plastic waste collection, recycling and environmentally sound disposal. The subsequent introduction of Extended Producer Responsibility strengthened the responsibility of producers, importers and brand owners.

Plastic Waste Generation in India, 2018–19 to 2022–23

Financial Year	Plastic waste generation (tonnes)
2018–19	33,60,043
2019–20	34,69,782
2020–21	41,26,808
2021–22	39,01,802
2022–23	41,36,188

Trend in Plastic Waste Generation in India



Source: Ministry of Environment, Forest and Climate Change, Government of India; CPCB data reported in Parliament.

Analysis:

- ❖ The data reveal that plastic waste generation increased from approximately 3.36 million tonnes in 2018–19 to 4.14 million tonnes in 2022–23.
- ❖ This represents an increase of approximately 23.1% over the period.
- ❖ The increase highlights the importance of effective plastic waste management policies. EPR mechanisms encourage producers to finance and organise the collection and processing of plastic packaging waste.
- ❖ The CPCB Annual Report 2022–23 also reported an EPR target of 30.72 lakh tonnes for registered producers, importers and brand owners.

The economic implications include:

- Expansion of plastic recycling industries.
- Increased demand for recycled plastic materials.
- Development of alternative packaging materials.
- Reduction in the use of virgin plastic resources.
- Opportunities for employment and entrepreneurship.

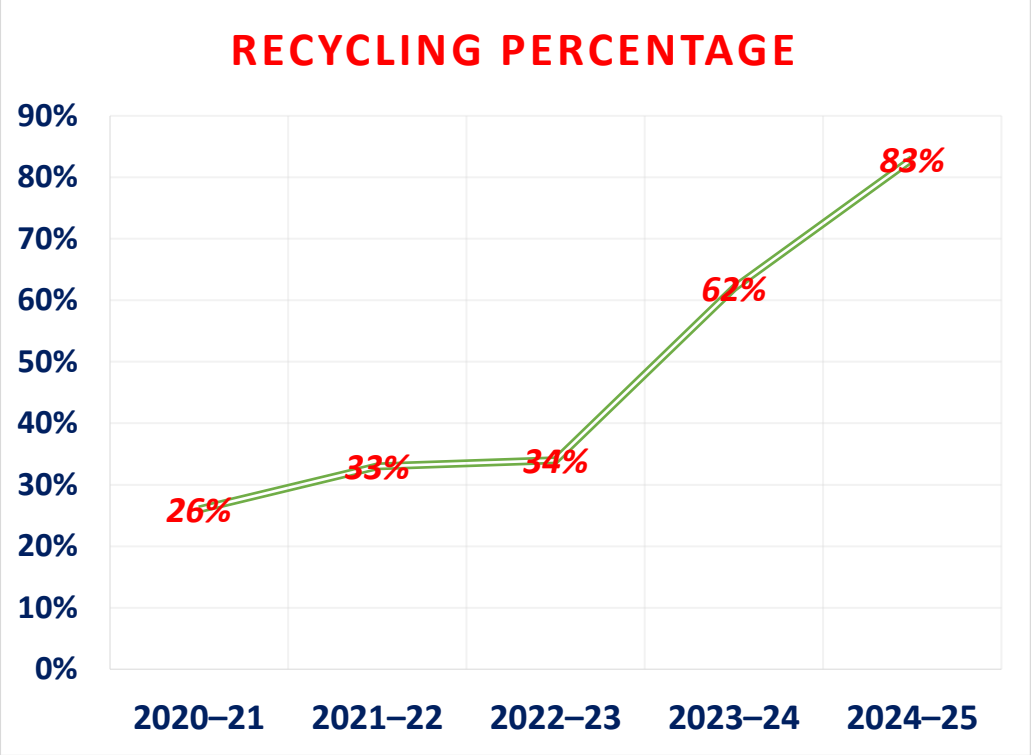
However, recycling alone cannot solve the plastic waste problem. Reduction in unnecessary plastic consumption, reusable packaging and improved product design are equally important.

Electronic Waste Generation and Recycling

Electronic waste (e-waste) includes discarded computers, mobile phones, televisions, electrical appliances and other electronic equipment. The increasing use of digital technology, electronic devices and consumer appliances has contributed to the growth of e-waste in India. The E-Waste (Management) Rules, 2022, effective from 1 April 2023, introduced an improved EPR framework and mandatory registration of relevant producers, refurbishers and recyclers.

E-Waste Generation and Recycling in India

Financial Year	**E-waste generated (tonnes)**	**Reported recycled (tonnes)**	**Recycling percentage**
2020–21	13,46,496	3,54,541	26%
2021–22	16,01,155	5,27,132	33%
2022–23	16,09,117	5,39,256	34%
2023–24	12,54,287	7,78,205	62%
2024–25	13,97,956	11,59,228	83%



Source: Ministry of Environment, Forest and Climate Change data reproduced by PRS Legislative Research, 2026.

Analysis:

- ❖ The reported recycling percentage increased from 26% in 2020–21 to 83% in 2024–25. This indicates considerable improvement in reported e-waste recycling performance.
- ❖ The figures for 2023–24 and 2024–25 reflect the newer EPR framework and should be interpreted with caution when compared with earlier years because reporting and regulatory coverage have changed.
- ❖ The development of organised recycling facilities can contribute to the recovery of valuable materials such as copper, aluminium, gold and other metals. It also reduces dependence on virgin mineral resources.

The expansion of formal recycling systems can create new investment opportunities in:

- Electronic component recovery.
- Battery recycling.
- Refurbishment and repair services.
- Recovery of precious metals.
- Environmentally safe dismantling facilities.

Major Waste Management Policies and Their Influence on Circular Economy

Major Waste Management Policies in India

Policy/Regulation	Year	Contribution to circular economy
Solid Waste Management Rules	2016	Segregation, collection, processing and scientific disposal
Plastic Waste Management Rules	2016	Plastic recycling and producer responsibility
Construction and Demolition Waste Management Rules	2016	Recovery and reuse of construction materials
E-Waste Management Rules	2022	EPR-based electronic waste recycling

Battery Waste Management Rules	2022	Battery collection, recycling and material recovery
Extended Producer Responsibility	Various amendments	Producer accountability and recycling obligations
Swachh Bharat Mission	2014 onwards	Improved sanitation and solid waste management

Source: Government of India policy documents and Ministry of Environment, Forest and Climate Change.

Influence of Waste Management Policies on Economic Development: Waste management policies influence the circular economy through several economic mechanisms.

1. Resource efficiency: Recycling and reuse reduce the demand for virgin raw materials. Industries can reduce production costs by using recovered materials wherever technically and economically feasible.
2. Employment generation: Waste collection, sorting, recycling, composting and refurbishment create employment opportunities. These activities also provide scope for small enterprises and social entrepreneurship.
3. Industrial development: Waste processing encourages the development of recycling plants, material recovery facilities, waste-to-energy infrastructure and environmentally friendly manufacturing.
4. Reduction in environmental costs: Scientific waste management reduces open dumping, pollution and the economic costs associated with environmental damage.
5. Green entrepreneurship: Circular economic policies encourage start-ups in reusable packaging, recycling technologies, composting, repair services and sustainable product design.

Relationship between Waste Management Policy and Circular Economy: The following framework explains the relationship between government policy and circular economic development.

Circular Economy Policy Framework	
Government Waste Management Policies (Regulations • EPR • Recycling standards • Incentives)	
↓	↓
Waste Reduction (Reduce consumption and packaging) Reuse and Repair (Extend product life cycles)	Collection and Segregation (Source separation and recovery) Recycling and Recovery (Convert waste into useful materials)
↓	
Circular Economic Development (Resource efficiency • Green employment • Sustainable industries)	
↓	
Sustainable Development (Environmental protection • Economic growth • Social welfare)	

The framework demonstrates that government policies influence circular economic development by creating regulatory incentives and encouraging changes in production and consumption patterns.

Economic Opportunities in the Circular Economy: The transition towards a circular economy creates opportunities in several sectors.

Sector	**Economic opportunity**
Agriculture	Organic compost and biofertilisers
Plastic industry	Recycled plastic products
Electronics	E-waste recovery and refurbishment
Construction	Recycled aggregates and construction materials
Energy	Biogas and waste-derived energy

Manufacturing	Secondary raw material utilisation
Urban services	Waste collection and recycling enterprises

These activities can strengthen local economies, encourage innovation and improve the productive utilisation of resources.

Major Findings of the Study: Based on the analysis of secondary data, government policies and institutional reports, the following findings emerge.

1. Increasing waste generation: Rapid urbanisation, industrialisation and changing consumption patterns have increased the volume of municipal, plastic and electronic waste in India.
2. Importance of government policies: The Solid Waste Management Rules, Plastic Waste Management Rules and E-Waste Management Rules provide an important regulatory foundation for sustainable waste management.
3. Improvement in waste processing: The municipal waste data indicate that approximately 53.72% of reported waste generation was processed or treated in 2021–22, demonstrating the need for additional processing infrastructure.
4. Growth in plastic waste: Plastic waste generation increased from approximately 3.36 million tonnes in 2018–19 to 4.14 million tonnes in 2022–23. This demonstrates the continuing need for effective plastic reduction and recycling measures.
5. Improvement in e-waste recycling: The reported e-waste recycling rate increased from 26% in 2020–21 to 83% in 2024–25. The improved EPR framework and formal recycling mechanisms have contributed to the development of organised recycling activities.
6. Role of producer responsibility: Extended Producer Responsibility has strengthened the accountability of manufacturers and brand owners for the collection and processing of waste generated by their products.
7. Employment opportunities: Recycling, repair, refurbishment, composting and waste processing activities provide opportunities for employment generation and entrepreneurship.
8. Technological development: Digital monitoring, automated sorting, waste tracking and advanced recycling technologies can improve waste management efficiency.
9. Informal sector participation: Waste pickers and informal recycling enterprises play an important role in material recovery. Their integration into formal waste management systems is essential for inclusive circular economic development.
10. Implementation challenges: Inadequate infrastructure, limited financial resources, insufficient public awareness, weak enforcement and inconsistent data reporting continue to restrict the effectiveness of waste management policies.

Suggestions and Policy Recommendations: To strengthen the influence of waste management policies on the circular economy, the following measures are suggested.

- **Strengthening Policy Implementation:** The central and state governments should strengthen the implementation of existing waste management regulations. Regular monitoring, transparent reporting and effective enforcement are essential to achieving policy objectives.
- **Promoting Waste Segregation at Source:** Households, commercial establishments, educational institutions and industries should be encouraged to segregate waste into biodegradable, recyclable and hazardous categories. Local governments should ensure separate collection and appropriate transportation of different waste streams.
- **Strengthening Recycling Infrastructure:** Investment should be increased in material recovery facilities, composting plants, plastic recycling units, electronic waste processing facilities and scientific waste treatment infrastructure. Public-private partnerships can help mobilise financial resources and technological expertise.
- **Expanding Extended Producer Responsibility:** EPR should be implemented effectively across plastic packaging, electronic equipment and batteries. Producers should be encouraged to adopt environmentally responsible product designs, reusable packaging and recyclable materials. Digital tracking and independent verification of recycling certificates should be strengthened to prevent false reporting.

- **Integrating the Informal Waste Sector:** Waste pickers, small-scale collectors and informal recycling enterprises should be integrated into formal waste management systems.

  Governments should provide:

  - Occupational safety equipment.
  - Skill development programmes.
  - Social security and insurance.
  - Access to formal recycling markets.
  - Financial assistance for small enterprises.
- **Promoting Green Entrepreneurship:** Financial assistance, tax incentives, credit facilities and technology support should be provided to start-ups and small enterprises engaged in waste recycling, repair, reuse and resource recovery.
- **Encouraging Industrial Symbiosis:** Industries should be encouraged to utilise the waste and by-products of other industries as productive inputs. For example, fly ash from thermal power plants can be utilised in cement and construction materials, while suitable organic waste can be converted into compost and biogas.
- **Improving Public Awareness:** Environmental education should be strengthened in schools, colleges and universities. Community participation, awareness campaigns and local recycling programmes can encourage responsible consumption and waste reduction.
- **Digitalisation of Waste Management:** Governments should introduce digital waste management systems using GPS tracking, mobile applications, artificial intelligence and data analytics. These technologies can improve collection efficiency, monitor recycling performance and enhance transparency.
- **Promoting Research and Development:** Universities, research institutions and industries should undertake research on biodegradable packaging, advanced recycling technologies, waste-to-resource conversion and sustainable manufacturing.
- **Strengthening Local Government Finance:** Urban local bodies and Gram Panchayats should receive adequate financial assistance to develop waste collection, segregation, processing and recycling facilities. Performance-based funding can encourage municipalities to improve waste processing and resource recovery.
- **Introducing Circular Economy Indicators:** A national monitoring framework should measure:
  - Waste generation per capita.
  - Waste collection efficiency.
  - Recycling and recovery rates.
  - Share of recycled materials in manufacturing.
  - Reduction in landfill disposal.
  - Employment in recycling industries.
  - Resource productivity.

Such indicators can help evaluate the effectiveness of waste management policies and identify areas requiring improvement.

Conclusion

Waste management policy is important to foster the circular economy by turning waste from an environmental liability into an economic resource. The traditional linear economic model based on the continuous extraction, production, consumption and disposal of resources is increasingly unsustainable when considering resource scarcity, environmental degradation and climate change . The present study shows that effective waste management policies can contribute to resource conservation, recycling industry development, job creation, technological innovation and sustainable economic growth. The Indian experience emphasizes the necessity of regulatory structures like Solid Waste Management Rules, 2016, Plastic Waste Management Rules, 2016, E-Waste Management Rules, 2022, Battery Waste Management Rules, 2022 and Extended Producer Responsibility mechanisms. The statistical analysis shows both significant progress and considerable challenges. Municipal solid waste processing needs to be further enhanced, generation of plastic waste remains high, and reported e-waste recycling performance has improved considerably. These developments suggest the need for more robust policy implementation, better infrastructure and improved

institutional coordination. The shift to a circular economy calls for co-operation that involves government institutions, industry, households, research organizations and civil society. Particular attention should be paid to the integration of informal waste workers, support to small recycling enterprises, strengthening of local government institutions and promotion of environmentally responsible production and consumption. Finally, waste management should be considered as an environmental responsibility and a significant part of economic policy. An efficient waste management system, if designed and implemented well, can facilitate India's transition toward a resource-efficient, inclusive and sustainable economy. Thus, the integration of waste management policies with industrial development, employment generation, technological innovations and environmental governance is essential for long-term circular economic development.
